

Job description - Software Engineering

AMTS, Tableau

We're Salesforce, the Customer Company, inspiring the future of business with AI+ Data+ CRM. Leading with our core values, we help companies across every industry blaze new trails and connect with customers in a whole new way. And, we empower you to be a Trailblazer, too – driving your performance and career growth, charting new paths, and improving the state of the world. If you believe in business as the greatest platform for change and in companies doing well and doing good – you've come to the right place.

At Tableau, we are on a mission to help people see and understand data. With Tableau we offer our customers an easy-to-use, self-service analytics cloud platform designed to deliver insights where you work. We create intuitive and powerful analytics software that enables thousands of leading organizations and millions of people around the world to find insights in their data. With data governance, security and compliance built in, Tableau offers the most choice and flexibility as your technology and AI strategy evolve. Tableau is committed to supporting the needs of organizations around the world with the largest partner and success ecosystem.

We are looking for technically strong **Software Engineers** who are passionate about developing, maintaining and releasing high quality software that delights our customers. The software engineer role at Salesforce encompasses architecture, design, implementation, and testing to ensure we build products right and release them with high quality. You will be working with a group of world-class engineers to develop key product capabilities, fixing defects and gaps, validating quality and ensuring our customers have highly reliable and scalable products and services. We pride ourselves in writing high-quality, maintainable code that strengthens the stability of the product and makes our

lives easier. You will collaborate with cross-functional teams and ensure the delivery of high-quality software solutions that meet our needs. We believe that autonomous teams with the freedom to make decisions will empower the individuals, the product, the company, and the customers they serve to thrive.

Responsibilities

- Development and maintenance of robust and scalable client & server-side components
- Investigate, troubleshoot and resolve customer defects and production issues with Tableau products in a timely manner.
- Triage and resolve basic, well-defined, work items and customer defects with needed guidance.
- Leverage AI tools across the lifecycle of work items
- Analyze product log files, crash dumps, network traces, etc.
- Write code (new development, bug fixes), and automated tests, and ensure adherence to coding standards, quality standards and best practices.
- Develop understanding of how the fixed module integrates with the broader product.
- Learn technologies, design patterns, and Engineering Best Practices.
- Work in a Hybrid Engineering model, collaborating with product managers, architects, and other stakeholders to define technical requirements and specifications.
- Strive to improve your work every sprint by making small changes to your approach.
- Clearly document steps-to-reproduce, root cause analysis (RCA) findings, logical fix explanations.
- Log and provide timely status updates on assigned work items.
- Transparently share progress and roadblocks with their mentor and senior engineers.

Qualifications

- Experience B.S/M.S. in Computer Sciences or equivalent field.
- 0-2 years of relevant software development experience with deep working expertise primarily in C++ 17 or Java 17 and later.
- Experience in other languages like, Javascript, Typescript, C# will be good to have
- Experience in software engineering development paradigms and best practices, with high focus on reliability and quality.
- Understanding of architecture principles, design patterns, multithreading, concurrency, queues, locks, scheduling, event-driven architecture, workload

distribution, along with a deep understanding of relational databases and non-relational databases.

- Understanding of object-oriented programming
- Understanding of debugging and performance optimization techniques
- Familiarity with relational databases and SQL queries.
- Understanding of Agile methodologies and software engineering best practices including coding standards, SCM, CI, build processes, testing, and operations.
- Excellent problem-solving, organizational and analytical skills
- **Preferred:** Experience working in enterprise-level SaaS products and deploying services on public cloud platforms (GCP, AWS, Azure).
- **Preferred:** Experience working in large scale distributed systems, working with microservices, container orchestration and/or distributed architecture.
- **Preferred:** Experience in data processing, data transformation and analytical technologies.
- **Preferred:** Contributions to personal projects, hackathons, or open-source repositories (e.g., GitHub portfolio).
